

Finding parts & verifying you want them. 4 Options:

- Email the cart with alias (might be the only option)
 - Create user in app.
 - App provides an email address like stephen_orders@fastapp.com
 - Parser (could be done by a person instead of through code)
 - Attach the order to the appropriate user (ppl could mimic each other)
 - Maybe get a temp email form website
 - Notification the order has been parsed
 - Standard checkout experience
 - Verify order items
 - Verify total cost
 - Delivery address
 - Delivery fee
 - Provide delivery instructions
 - Payment
 - For MVP might direct user to external site
- Parts database (concierge procurement)
 - Parts don't exist
 - Pre submission: ?
 - After submission: we need to recommend alternatives
 - Do stuff across multiple stores
 - Non-verified if in stock and someone would be looking it up
 - Is it an api? Is it static?
 - Eventually can end up like a standard checkout exp.
- Smart iFrame
 - Similar to cart, but could skip waiting for a notification
 - We don't know how plausible this is yet
 - Maybe putting it into an iFrame is against terms of service
- Chat experience

App vs Website - Price Differential?

- App version - \$1.5k base before development
